

## **FOR IMMEDIATE RELEASE**

### **DIGITAL SAMURAI SLICES THROUGH THE HYPE TO DELIVER COMMENTARY ON THE CUTTING EDGE**

October 22, 2008 – Fairfax, Virginia. Privacy is either dead, or on life support. That’s the straightforward conclusion of the Digital Samurai, a new IT blog written by two technology professionals who aren’t afraid to tell it like it is.

In their most recent blog post, they reveal that Swiss researchers have figured out a way to record keystrokes directly from a person’s keyboard wirelessly, from a distance of up to twenty meters away – using a simple radio antenna and relatively inexpensive equipment.

“Clearly, this technology could assist criminals in stealing personal and confidential information,” the blog asserts, “such as passwords, social security numbers and other information inputted by a user without detection. Gee, do you think they’ll figure that out quickly?”

The men behind the irreverent blog are John W. Simek, a noted author, lecturer, and Vice President of Sensei Enterprises; and Michael Maschke, Director of Computer Forensics at Sensei.

“Digital Samurai gives John and Mike a place to talk about everything IT related,” said Sharon D. Nelson, Esq., President of Sensei Enterprises and the author of Ride the Lightning, her own blog about electronic evidence and e-discovery. “A lot of legal tech will be covered, because Sensei acts as IT consultants to over 200 law firms in the metro D.C. area. But John and Mike will cover technology generally as well -- no holds are barred, the gloves are off, and there are no sacred cows.”

The blog’s name was chosen with respect for the samurai of feudal Japan. They were fierce warriors, skilled with both pen and sword, and lived by the code of Bushido, which stressed loyalty, mastery, and honor. Both Simek and Maschke promise to be loyal to their readers, and use their mastery of Information Technology to give honest evaluations of the state of the art – to become the Digital Samurai of the modern age.
